

MechRel 2011 “Read Me”

- 1) A sample MechRel project file is placed in the Program Files\MechRel\UserData directory during installation of MechRel. Please replace that sample.mch with the one available for download.
- 2) Windows 7 and Windows Vista have increased security restrictions for folders by default. Please go to the following folders:

C:\Program Files\MechRel\Config
C:\Program Files\MechRel\UserData

And change permissions to allow full control. This is done in Windows 7 in the following steps. While in Windows explorer, right-click on the folder. Select properties. Select Security Tab. Click on the change permissions edit button. Click on users group. Select full control. Click ok. This will allow you to save your work.

- 3) Dot Net Framework version 2.0 redistributable package is required to run MechRel. It may be already installed. To find out, just run MechRel. If required, you may download it from Microsoft at:
<http://search.microsoft.com/search/results.aspx?st=b&na=88&View=en-us&qu=.net+framework>

Important: You may have a newer version of dot net framework. Version 2.0 is still required. It's ok to have two versions installed.
